

Xpedient Logistics

Warehouse Inventory Management

Getting It Right the First Time, On Time

Challenge

A robust, stable, and accurate inventory management system is the lifeblood of every logistics company. So, when Xpedient Logistics retires its existing SaaS solution and asks you to create something new and deliver it with no room for downtime, you best be on top of your game.

Solution

Liberty Fox worked closely with Xpedient and conducted an intense business analysis to gather business requirements and establish a set of business rules to handle the complex and customized logic inherent in the inventory management process.

Technology

Based on these requirements and the need to automate and integrate previously manual efforts, a new base application was created that included a custom inventory picking application and the ability to import bulk data from csv files. All was accomplished with strict adherence to project management protocols to support the timeline

The initial stand-up was able to support Xpedient's needs during a transition period and prevent any slowdowns in operations that could have a negative impact on clients.

Outcomes

A continuing partnership between Liberty Fox and Xpedient led to an expansion of the application to include the ability to manage containers and orders directly, as well as a more robust reporting interface. The company now has a much greater grasp of day-to-day business with real-time reporting, accurate inventory counts, and an improved user experience.
